

PRODUCT INFORMATION AND DIRECTIONS FOR USE

Congratulations on your purchase of the bedbugdot, first ever early-warning detection system. No one wants their homes to be a breeding ground for bed bugs and checking your bedbugdot will make sure that doesn't happen!

Bedbugdot is a maintenance-free, early-warning detection system of choice by pest control, hotels, schools, dorms, daycare, senior facilities, homes and businesses everywhere!

Bed bugs relocate on people's clothing, luggage, personal items and furniture. Because of the bed bugs size and hidden nature, they can be difficult to find and costly to control if not detected early.

Early detection is required to prevent and eliminate bed bugs before the problem has an opportunity to grow and spread. Used in both early and post control efforts, bedbugdot gives you control over unwanted guests.

Bedbugdot provides you with 24-hour bed bug awareness, an easy way to discover bed bugs BEFORE an infestation can build and a simple way to track bed bug activity.

INSTALLATION

Proper placement of bedbugdot is required for success of early detection.

- Bedbugdot comes with a removable sticky pad attached and can be installed with or without applying to surfaces.
- For areas that you need to secure, gently remove film and install firmly on a surface where it will not be touched or moved and can be observed.
- Or place bedbugdot in-between cushions, mattresses or fabrics without removing film.
- Always place bedbugdot as close to bed bug feeding areas as possible.

IMPORTANT NOTES ON INSTALLATION SURFACES:

Although bedbugdot has a removable sticky pad, refrain from applying sticky tabs to sensitive surfaces (e.g., wallpapered or painted surfaces, polished wood furnishings, or plastic mattress encasements)

WHERE TO INSTALL

Humans are a bed bugs food source, discovery is most efficient when installed on commonly occupied areas. Beds, Seats and Chairs, Couches, Vehicles, etc.

Placement can vary with furniture designs and location. Some install site examples are shown in the images *See figures 1-7*

Visit www.bedbugdot.com for whole room environment illustrations showing all the common places bed bugs may hide.

INSPECTION

You do not need to remove bedbugdot to inspect. Turn on a light or use a flashlight and magnifying glass for examination in dark areas.

WHERE TO LOOK

Examine the area on and around bedbugdot. If no signs of bed bugs are present, check your calendar and leave in place for next inspection date.

Bedbugdot was designed to check for bed bugs often and especially BEFORE they build into infestation levels.

WHAT TO LOOK FOR

- Any live insects
- Any dark spots (Fecal spots)
- Cast skins (yellow or white paper-thin skin)
- Eggs

FINDING SIGNS

If fecal spots or cast skins are found anywhere in, on or around the bedbugdot there may more in surrounding areas.

WHEN TO CALL A PROFESSIONAL

If you notice any bed bug activity or signs in, on or around the dot, contact your bed bug professional directly. The purpose of the bedbugdot is to help you take care of the problem before they get a chance to reproduce and spread.

NOTE: The bedbugdot was not designed to trap, monitor, eliminate or treat a bed bug infested area, but to create awareness and help you detect early presence of bed bugs.

HOW OFTEN SHOULD I INSPECT FOR BED BUG SIGNS?

Daily: For someone being bitten regularly, hotels, nursing homes, hospital waiting rooms or a previously infested premise.

Weekly: For frequent travelers and following a treatment.

Monthly: For homes, businesses, tenants or apartment living (anywhere for ongoing early detection)

KEEPING TRACK

Keep track of the days you inspect your bedbugdot areas on your own calendar or visit our website to download and print a bedbugdot calendar created especially for you!

Find the Spot... Apply the Dot!

Designed to fit any furniture, anywhere. The modest size can fit into the smallest of areas or designs. Place them close to where people most often occupy.

COUCHES: Install bedbugdot approximately 1/2" back under front edge of couch frame where people sit most often. Install between cushions or corners near arm rests.

SITTING CHAIRS: Install bedbugdot about 1/2" inch back under the front of the sitting chair frame and in corners of sitting area

RECLINERS: Place chair in reclining position. Install bed bug dots under leg extension at front edge about 1/2" back from edge of frame and in corners of sitting area.

MATTRESSES: Install bedbugdot on the head of the bed behind the mattress, between the mattress or under the box spring.

BED FRAMES: Install bedbugdot inside and outside of bed headboard or on the back of mattresses and box springs.

BASEBOARDS AND WALL BOARDS: bedbugdot can be installed on baseboards behind and near resting areas. (Chairs, beds, couches)

VEHICLES, (VANS, TRUCKS): Install bedbugdot under the front seat or on the front of the cushion under the legs of the driver side or where seats are often occupied.

PLANES: Install bedbugdot, two per seat, one forward and one back. In baggage area, one every two feet.

SCHOOLS, DAYCARE: cubbies/lockers place where personal belonging are stored.

There are numerous places where bedbugdot can be installed. Remember, place in occupied spaces where people come to rest.

SIGNS OF BED BUGS

- Live Bed Bugs
- Eggs
- Fecal Traces and Stain
- Cast Skins
- Blood spots on sheets
- Bites (Not always will people react to the bite)

The longer bed bugs reside in a dwelling, the more you will have that move to other locations.

Bedbugdot website provides pictures and detailed information about bed bugs. Please visit our site and learn all you can about their behavior. www.bedbugdot.com

KEEP OUT OF REACH OF CHILDREN AND PETS

DESCRIPTION, HABITS AND LIFE CYCLE

An adult bed bug is flat, oval, reddish-brown, and approximately 3/16 inch in size. They are sometimes mistaken for other household pests like cockroaches, ticks and carpet beetles.

- Bed bugs do not jump or fly but can move swiftly.
 - Flattened bodies enable them to fit into tiny crevices
 - Bed bugs are active mainly at night but will adjust to the human's lifestyle
- Preferred habitat is cloth, wood and paper surfaces close to where people sleep
- In heavier infestations, they may occupy hiding places further from the bed
- Bed bugs are tough and can persist months without feeding
- Bed bugs can survive for many months between feeds although if a source of food is present they will be active
- Can produce multiple generations per year
- Adult females must feed in order to lay eggs
- Eggs attach to surfaces by a sticky substance
- Eggs hatch in seven to ten days and feed right away
- Young bed bugs shed their skin five times before reaching adult stage
- Bed bugs must have a blood meal between each stage
- Complete life cycle takes approximately twenty two (22) to thirty six (36) days with regular blood meals
- Limited access to blood and cooler temperatures prolong development time

(Detailed and close-up pictures of bed bugs can be found at www.bedbugdot.com)
